

# Rational Least Squares Fitting using Krylov Spaces

Mario Berljafa<sup>\*</sup>      Stefan Güttel<sup>\*</sup>

For given matrices  $\{A, F\} \subset \mathbb{C}^{N \times N}$  and a vector  $\mathbf{v} \in \mathbb{C}^N$ , we consider the problem of finding a rational function  $R_m^{\min}$  of type  $(m, m)$  such that

$$\|F\mathbf{v} - R_m(A)\mathbf{v}\|_2^2 \rightarrow \min,$$

and propose an iterative algorithm [1, 2] for its solution. At each iteration the algorithm constructs a rational Krylov space  $\mathcal{Q}_{m+1}(A, \mathbf{v})$  and manipulates an associated Arnoldi decomposition to find better approximations to the poles of  $R_m^{\min}$ . In the special case when  $A = \text{diag}(\lambda_j)$  and  $F = \text{diag}(\psi_j)$  are diagonal we have a weighted rational least squares fitting problem  $\sum_{j=1}^N |v_j|^2 \cdot |\psi_j - R_m(\lambda_j)|^2 \rightarrow \min$ , and compare our method to the popular *vector fitting* [3].
